

Our country, Iran has opportunities with a population of about eighty million and on average, eight hundred grams of household, garden, office and other types of waste are produced per day.

That means 64 million kilograms or 64,000 tons a day

Seventy percent of this waste is 44,000 tons per day and is the best feed of Eisenia Fuchida protein cream that can feed the country's livestock, poultry and aquatic animals.

Of these 44,000 tons, in addition to the production of protein cream, at least 20% of vermicompost is obtained daily, which is used twice, first as feed for livestock, poultry and aquatic animals, and second as organic, rich and organic fertilizer for lands and gardens, which is a suitable alternative to chemical fertilizers. .

Do not bury 9,000 tons of protein per day and do not produce leachate, it is enough to separate it at the source and process it; And with at least two thousand tomans per kilogram, equivalent to seven thousand billion tomans of gold per year, do not bury it and turn it into leachate!

There is no need to invest in the villages of the country at all, and every villager should leave some worms in his garbage next to the garden and a corner of the land
